

Idea:

Graph

Closeness centrality

the space that is most easily reachable from everywhere else

Degree centrality

connectivity

Betweenness centrality

pure circulation

Semantic graph

Day factor

Architecture

Communal space

**separates communal
spaces from
peripheral rooms**

**communal centrality
from circulation
centrality**

**Peripheral rooms are
better lighted than
central rooms**

I want to see whether the spaces with high graph centrality are also the well-daylit communal spaces — and whether graph analysis can capture the architectural intuition of placing the social heart of the building where it is both topologically central and full of light.

Kindergartens vs office buildings
